

SUMMARY

The purpose of this project was to study employee information and understand the reasons why some employees leave a company. Keeping good employees is important because hiring and training new employees takes time, money, and effort. By understanding the common reasons behind employee turnover, a company can take better steps to improve employee satisfaction and reduce the number of people leaving.

The data used in this project contained information about **1,470 employees**. Among them, **237 employees left the company**, while the remaining employees continued working. This means that around **16% of employees left the organization**. The study looked at different details such as age, salary, work experience, years in the company, overtime work, distance from home, and relationship with managers to understand how these factors may affect an employee's decision to stay or leave.

After carefully studying the data, it was observed that employee attrition does not happen because of only one reason. Instead, several factors work together. Employees who worked overtime more often, had lower monthly income, had fewer years in the company, or had less work experience appeared to leave more frequently. In some cases, employees who lived farther from the workplace also showed a higher chance of leaving. A good relationship with managers and a better work environment appeared to help employees stay with the company.

Different approaches were compared to find which one could better identify employees who may leave in the future. One approach gave more reliable results than the others and was able to recognize employee leaving patterns more accurately. This shows that employee data can help organizations make better decisions and identify problems before employees decide to resign.

These findings can help the HR team:

- Identify employees who may be at risk of leaving.
- Improve employee satisfaction and work-life balance.
- Review overtime policies and career growth opportunities.
- Focus on employee retention through better support and engagement.

In conclusion, this analysis shows that employee attrition is influenced by several work-related and personal factors rather than a single reason. Understanding these patterns allows the company to support employees better and create a more positive workplace. By taking timely action based on these findings, the organization can improve employee retention, reduce hiring costs, and build a stronger and more stable workforce for the future.

HR Insights : Based on the analysis, the three biggest reasons why employees leave are working overtime frequently, receiving a lower monthly salary, and having fewer years of experience in the company. Employees who work long hours and are in the company for only a short time are more likely to leave. Some job roles, especially Sales Representatives (or replace this with the role that appeared highest in your results), also have a higher number of employees leaving. This means HR should focus more on these employees and understand their problems early. Salary is important, but it is not the only reason people leave. Things like work pressure, overtime, job satisfaction, and work-life balance also play a very important role in an employee's decision to stay or leave.

Recommendations for HR

1. HR should regularly talk to new employees and employees who work overtime to understand their concerns before they decide to resign. Early support can help improve employee satisfaction and reduce resignations.
2. The company should review the workload and salary of employees, especially in departments or job roles with high attrition. Providing fair pay, better work-life balance, and career growth opportunities can help keep employees happy and encourage them to stay longer.

Limitation of This Analysis

This analysis is based only on the information available in the dataset. It cannot understand personal reasons such as family problems, health issues, better job offers, or relationships with managers. Therefore, the results should be used as a guide to support HR decisions, not as the only reason for making decisions about employees.
